## 1 Introduction

### 1.1 Revision history

Date	Rev	Characteristics	Prepared
2005-07-15	PA1	First draft version	ETHJGI
2005-07-20	PA2	Updated after review	ETHJGI
2006-12-01	PB1	RFC 3046 and 3442 addition	ETHGBH
2006-12-15	PB2	Update after inspection	ETHGBH
2007-03-07	PC1	Updated for TITAN R7	ETHBAAT
2012-05-09	PD1	Implemented CR_TR00019274	ETHEKR

### 1.2 About this Document

#### 1.2.1 How to Read this Document

This is the User Guide for the DHCP protocol module. The DHCP protocol module is developed for the TTCN-3 Toolset with TITAN. This document should be read together with Product Revision Information [4] and Function Specification [5]

#### 1.2.2 Presumed Knowledge

To use this protocol module the knowledge of the TTCN-3 language [1] is essential.

The DHCP protocol is specified in the RFC-s [6], [7], [8], [9] and [11].

#### 1.2.4 Abbreviations

DHCP	Dynamic Host Configuration Protocol
ES	ETSI Standard
ETSI	European Telecommunications Standards Institute
GUI	Graphical User Interface
RFC	Request for Comments
TTCN-3	Testing and Test Control Notation version 3

#### 1.2.5 Terminology

No specific terminology is used.

### 1.3 System Requirements

Protocol modules are a set of TTCN-3 source code files that can be used as part of TTCN-3 test suites only. Hence, protocol modules alone do not put specific requirements on the system used. However, in order to compile and execute a TTCN-3 test suite using the set of protocol modules the following system requirements must be satisfied:

- TITAN TTCN-3 Test Executor version R7A (1.7.pl0) or higher installed. For installation guide see [2]. Please note: This version of the protocol module is not compatible with TITAN releases earlier than R7A.

## 2 Protocol Modules

### 2.1 Overview

Protocol modules implement the message structures of the related protocol in a formalized way, using the standard specification language TTCN-3. This allows defining of test data (templates) in the TTCN-3 language [1] and correctly encoding/decoding messages when executing test suites using the Titan TTCN-3 test environment.

Protocol modules are using Titan's RAW encoding attributes [3] and hence are usable with the Titan TTCN-3 toolset only.

The DHCP protocol module is defined in two TTCN-3 modules. DHCP\_Types.ttcn defines the data structures given in [6] and DHCP\_Options.ttcn implements [7][8][9][11].

The file DHCP\_EncDec.cc implements the TTCN-3 external functions that can be used to encode/decode DHCP messages. Decoding of Option 82 is possible in different formats (See Appendix in [10]), therefore extra decoding function dec\_PDU\_DHCP\_Opt82 is available, which decodes Option 82 according to its input parameter.

Note that the DHCP *Option Overload* option is not supported by the Enc/Dec functions. The *sname* and *file* fields are decoded as charstrings with the null characters removed from their end.

When erroneous PDU is received, the message is decoded as follows:

- If the decoder cannot decode one of the DHCP options the erroneous option will be decoded as a DHCP\_General\_Option
- If the data cannot be decoded it is put into the erroneousPDU field in PDU\_DHCP as an octetstring.

Note, that the DHCP protocol module uses the types defined in the General\_Types module (Available in Common Protocol Module CNL 113 368).

### 2.2 Installation

The set of protocol modules can be used in developing TTCN-3 test suites using any text editor. However, to make the work more efficient a TTCN-3-enabled text editor is recommended (e.g. nedit, xemacs). Since the DHCP protocol is used as a part of a TTCN-3 test suite, this requires TTCN-3 Test Executor be installed before the module can be compiled and executed together with other parts of the test suite. For more details on the installation of TTCN-3 Test Executor see the relevant section of [2].

### 2.3 Configuration

None.

Prepared (also subject responsible if other) ETH/XZX Endre Kulcsár +36 1 437 7469		No. 198 17-CNL 113 461 Uen		
Approved ETH/XZXC (Tibor Csöndes)	Checked	Date 2012-06-14	Rev D	Reference GASK2

### 3 Example

The “demo” directory of the deliverable contains the files that show a simple example how to use the Enc/Dec functions to encode/decode a DHCP message.

To run the test case, follow these steps:

- Load the project definition file into the TITAN GUI
- Create the symbolic links
- Generate the Makefile
- Compile the executable
- Execute the test case(s)
